Range

Input group

Floating labels

Layout

Validation

Forms

Examples and usage guidelines for form control styles, layout options, and custom components for creating a wide variety of forms.

Form control

Style textual inputs and textareas with support for multiple states.

Checks & radios

Use our custom radio buttons and checkboxes in forms for selecting input options.

Input group

Attach labels and buttons to your inputs for increased semantic value.

Layout

Create inline, horizontal, or complex grid-based layouts with your forms.

Select

Improve browser default select elements with a custom initial appearance.

Range

Replace browser default range inputs with our custom version.

Floating labels

Create beautifully simple form labels that float over your input fields.

Validation

Validate your forms with custom or native validation behaviors and styles.

Overview

Bootstrap's form controls expand on our Rebooted form styles with classes. Use these classes to opt into their customized displays for a more consistent rendering across browsers and devices.

Be sure to use an appropriate type attribute on all inputs (e.g., email for email address or number for numerical information) to take advantage of newer input controls like email verification, number selection, and more.

Here's a quick example to demonstrate Bootstrap's form styles. Keep reading for documentation on required classes, form layout, and more.

Email address	
We'll never share your email with anyone else.	
Password	
Check me out	
Submit	
<form></form>	Сору
<pre><div class="mb-3"></div></pre>	
<pre> <div class="mb-3"></div></pre>	
<pre><input class="form-control" id="exampleInputPassword1" type="password"/> </pre>	
<pre><input class="form-check-input" id="exampleCheck1" type="checkbox"/> <label class="form-check-label" for="exampleCheck1">Check me out</label></pre>	
<button class="btn btn-primary" type="submit">Submit</button>	

Form text

Block-level or inline-level form text can be created using $\tt.form-text.$

Associating form text with form controls

Form text should be explicitly associated with the form control it relates to using the aria-describedby attribute. This will ensure that assistive technologies—such as screen readers—will announce this form text when the user focuses or enters the control.

Form text below inputs can be styled with .form-text. If a block-level element will be used, a top margin is added for easy spacing from the inputs above.

Inline text can use any typical inline HTML element (be it a , <small>, or something else) with nothing more than the .form-text class.

Disabled forms

Add the disabled boolean attribute on an input to prevent user interactions and make it appear lighter.

```
cinput class="form-control" id="disabledInput" type="text" placeholder="Disabled input here..." disagri
```

Add the disabled attribute to a <fieldset> to disable all the controls within. Browsers treat all native form controls (<input>, <select>, and <button> elements) inside a <fieldset disabled> as disabled, preventing both keyboard and mouse interactions on them.

However, if your form also includes custom button-like elements such as, these will only be given a style of pointer-events: none, meaning they are still focusable and operable using the keyboard. In this case, you must manually modify these controls by adding tabled" to prevent them from receiving focus and aria-disabled" to signal their state to assistive technologies.

Disabled fieldset example

Disabled input

```
Disabled select menu
 Disabled select
 Can't check this
                                                                                                    Сору
<form>
 <fieldset disabled>
   <legend>Disabled fieldset example</legend>
   <div class="mb-3">
     <label for="disabledTextInput" class="form-label">Disabled input</label>
     <input type="text" id="disabledTextInput" class="form-control" placeholder="Disabled input">
   </div>
   <div class="mb-3">
     <label for="disabledSelect" class="form-label">Disabled select menu</label>
     <select id="disabledSelect" class="form-select">
       <option>Disabled select</option>
     </select>
   </div>
   <div class="mb-3">
     <div class="form-check">
       <input class="form-check-input" type="checkbox" id="disabledFieldsetCheck" disabled>
       <label class="form-check-label" for="disabledFieldsetCheck">
        Can't check this
       </label>
   </div>
   <button type="submit" class="btn btn-primary">Submit</button>
 </fieldset>
</form>
```

Accessibility

Disabled input

Ensure that all form controls have an appropriate accessible name so that their purpose can be conveyed to users of assistive technologies. The simplest way to achieve this is to use a <label> element, or—in the case of buttons—to include sufficiently descriptive text as part of the <button>...</button> content.

For situations where it's not possible to include a visible <label> or appropriate text content, there are alternative ways of still providing an accessible name, such as:

- \bullet <label> elements hidden using the .visually-hidden class
- · Pointing to an existing element that can act as a label using aria-labelledby
- Providing a title attribute
- Explicitly setting the accessible name on an element using aria-label

If none of these are present, assistive technologies may resort to using the placeholder attribute as a fallback for the accessible name on <input> and <textarea> elements. The examples in this section provide a few suggested, case-specific approaches.

While using visually hidden content (.visually-hidden, aria-label, and even placeholder content, which disappears once a form field has content) will benefit assistive technology users, a lack of visible label text may still be problematic for certain users. Some form of visible label is generally the best approach, both for accessibility and usability.

Sass

Many form variables are set at a general level to be re-used and extended by individual form components. You'll see these most often as \$btn-input-* and \$input-* variables.

Variables

\$btn-input-* variables are shared global variables between our <u>buttons</u> and our form components. You'll find these frequently reassigned as values to other component-specific variables.

```
$input-btn-padding-y: .375rem;
$input-btn-padding-x: .75rem;
$input-btn-font-family: null;
$input-btn-font-size: $font-size-base;
$input-btn-line-height: $line-height-base;
```

```
$input-btn-focus-width: .25rem;
$input-btn-focus-color-opacity: .25;
$input-btn-focus-color:
                           rgba($component-active-bg, $input-btn-focus-color-opacity);
$input-btn-focus-blur:
                              0;
$input-btn-focus-box-shadow:
                             0 0 $input-btn-focus-blur $input-btn-focus-width $input-btn-focus-color
$input-btn-padding-y-sm:
                             .25rem;
$input-btn-padding-x-sm:
$input-btn-font-size-sm:
                            $font-size-sm;
$input-btn-padding-y-lg:
                             .5rem;
$input-btn-padding-x-lg:
                            1rem;
$input-btn-font-size-lg:
                            $font-size-lg;
$input-btn-border-width:
                            $border-width;
```
